Md. Utsob Bin Bari

Software Engineer — React Native & Cross-Platform Mobile

utsobbinbari@gmail.com · +880 1316 312208 · Dhaka, Bangladesh
github.com/Utsob-Bin-Bari · linkedin.com/in/utsob-bin-bari · utsobbinbariportfolio.netlify.app

OBJECTIVE

React Native engineer specialising in cross-platform mobile applications, with **end-to-end ownership from design implementation through development, optimisation, CI/CD and store deployment** . Have shipped production applications across **fintech, edtech, e-commerce, live sports streaming, and services marketplaces**, live on both Google Play and the App Store.

Currently on the mobile team at Tulip-Tech, rebuilding a production remittance application serving **50,000+ active users**, and responsible for new project bootstrap and release pipelines across the company's mobile projects. Comfortable contributing to API and shared contract layers where a feature requires it, though my depth and focus are firmly in mobile.

Seeking to build well-engineered mobile products at scale in a team that values performance, maintainability, and shipping to real users.

EDUCATION

Bangladesh University of Engineering and Technology (BUET) — B.Sc. in MME (2018 – 2023)
Govt. Azizul Haque College, Bogura — HSC (2015 – 2017), with Board Scholarship

TECHNICAL SKILLS

- **Programming Languages:** TypeScript, JavaScript (ES6+), C++, C, HTML, CSS
- **Mobile:** React Native (Expo Workflow & Bare Workflow), EAS (Build / Submit / Update, OTA), expo-router, React Navigation (stack, tab, drawer), Push Notification, deep linking
- **Frontend:** React, TailwindCSS, React Hook Form, Zod
- **Real-time & Streaming:** WebSocket (Socket.io, Supabase Realtime), LLM token-stream rendering, optimistic UI updates, 100ms SDK (real-time video), JW Player (video streaming)
- **Animation:** React Native Reanimated, react-native-worklets (UI-thread animation), Gesture Handler
- **State, Persistence & Database:** Zustand, Redux, Context API, TanStack React Query (infinite queries, cache persistence), MMKV, SQLite, AsyncStorage, Expo SecureStore
- **Backend, API & Auth:** Express, oRPC, REST API design and integration, JWT / OAuth2, session and token lifecycle management
- **Platform & CI/CD:** Android and iOS lifecycle, permissions, native configuration, Play Store and App Store publishing (signing, provisioning, review), mobile project bootstrap, Expo EAS Workflows, GitHub Actions, build profiles and environment configuration, OTA release management, Firebase Cloud Messaging, Notifee
- **Architecture:** Layered / Clean Architecture, Modular Architecture, Monorepo
- **Integrations:** Stripe, InPlayer, Sanity CMS, Meta Graph API, OpenAI API, Google Maps
- **Developer Tools:** Git, Postman, VS Code, XCode, Android Studio, Source Tree, Claude Code, Cursor

PROFESSIONAL EXPERIENCE

Software Engineer — Mobile Team | Tulip-Tech

December 2025 – Present

Own mobile applications through the full delivery cycle — **UI/UX design implementation, development, performance optimisation, store deployment, and CI/CD pipeline creation with Expo EAS.** Delivered two applications to production across both platforms. Also responsible for **new mobile project bootstrap and CI/CD setup across the company's projects** — standardising EAS Build, Submit, and OTA workflows, environment and build profiles, and release automation so new applications start from a consistent, deployable baseline. Serve as the team's reference for **design, animation and motion work**.

(1) Conected — Therapist Booking Marketplace (React Native, TypeScript) — *Delivered, live on iOS and Android*

App Store · Google Play

REAL-TIME CHAT IMPLEMENTATION

- Built a complete **real-time messaging system** end to end — conversation list, message thread, composer, attachments, read receipts, and moderation rules.
- Implemented **WebSocket live messaging** over Supabase Realtime broadcast channels, subscribing to a per-user channel so one global hook covers every conversation the user participates in.
- Applied **optimistic UI updates** — pending messages render instantly and reconcile against the server-confirmed message by `clientId`, with de-duplication by server id.
- Patched incoming messages **directly into the query cache rather than refetching**; conversations reorder in place on new activity.
- Built the thread on an **inverted `FlatList` with infinite scroll**, memoised row renderers, and skeleton states for smooth scrolling over long histories.

TECHNICAL IMPLEMENTATION

- **Push notifications** via Firebase Cloud Messaging and Notifee — dynamic badge counts, real-time notification channel, custom permission-denial modal.
- **Deep linking** (including account deletion) and Google Maps integration with location search, render guards, and hand-off navigation to the device's default map application.
- **Offline and low-connectivity resilience** using MMKV, query cache persistence, NetInfo-driven state, and pull-to-refresh with skeleton loaders throughout.
- Hardened authentication — re-navigation and store cleanup on 401/403, feature guards for chat and calling with user-facing status messaging.
- Integrated Stripe payments and complex booking flows: last-minute booking, multiple break times, evening slot handling, missed-booking reporting.

KEY RESPONSIBILITIES

- Sole mobile engineer — 405 commits from first screen through store submission on both platforms.
- Configured **EAS Workflows and GitHub Actions** for development, preview, and production build pipelines.
- Contributed backend changes (payment refund states) and shared validation schemas where mobile requirements demanded it.

(2) Corrigan Sports — Live Sports Streaming Application (React Native) — *Delivered, live on iOS*

App Store

- Built a **paid live-streaming application** for the US market covering high school and college lacrosse and American football.
- Integrated **JW Player** for live and on-demand video playback across varying network conditions.
- Implemented **InPlayer** for paid access, subscription entitlement, and paywall gating.
- Integrated **Sanity CMS** for dynamic content, event schedules, and editorial data.
- Delivered through **App Store review, signing, and provisioning** to production release.

(3) SonaliPay — Cross-Border Remittance Application (React Native, Expo, TypeScript) — *In Progress*

Full ground-up rebuild of a live production application serving 50,000+ active users, replacing the existing app while preserving continuity for an established user base under financial-services constraints.

TECHNICAL IMPLEMENTATION

- Rebuilding the customer mobile application end to end: authentication, KYC, beneficiaries, transfers, cards, and transaction history.
- Implemented **tiered KYC (Tier 1 / Tier 2)** with document capture and liveness detection via `react-native-vision-camera`, plus image normalisation for Azure verification.
- Delivered **Google and Apple OAuth** with profile auto-completion and postcode-to-address resolution via map integration.
- Engineered **banking-grade session security** — access tokens held in memory only and never persisted, a startup gate blocking jailbroken and rooted devices, screen-capture guard, biometric unlock, and remote device revocation.

- Built the shared API client handling bearer tokens, correlation IDs, **single-flight 401 refresh-and-replay**, maintenance-mode routing, and session-expiry cache invalidation.
- Shipped **8-language internationalisation (i18)** with per-script font resolution, bundling Noto Sans Bengali across nine weights alongside Poppins, with automated locale-parity checks.
- Implemented **forced in-app update** with version gating, plus EAS build profiles and Play Store auto-submit.

ANIMATION & OPTIMISATION

- Built **worklet-driven animations** with React Native Reanimated and react-native-worklets, running motion on the UI thread to hold frame rate — in-modal search transitions, fade in/out tab labels, animated flash messages, and screen transitions.
- **Centralised the animation layer** into a shared reusable module so motion stayed consistent and was defined once rather than re-implemented per screen.
- Replaced `expo-blur` with an opacity-based frosted treatment, cutting render cost on lower-end Android devices while preserving design intent.
- Migrated raster assets to SVG and standardised on shared themed UI atoms with dual light/dark support.

Full Stack React Native Developer | Scaledex — a concern of Fiber@Home

June 2025 – December 2025

Taraa — AI-First EduTech Mobile Application (React Native / Expo Workflow, TypeScript)

Led end-to-end development of an AI-first education application featuring **real-time video sessions with 100ms integration, AI-powered chat, a peer-to-peer messaging interface, and integrated in-app payment processing.**

TECHNICAL IMPLEMENTATION

- Architected and developed a feature-rich React Native (TypeScript) mobile application supporting modern AI-driven EdTech functionality.
- Integrated customised AI services to enhance conversational AI user experience and engagement, including **token-by-token streaming rendering** of model responses delivered as webhook chunks — implementing client-side buffering, ordering, and paced incremental rendering to produce a smooth typewriter effect.
- Implemented **WebSocket communication through Socket.io** for real-time messaging and data synchronisation.
- Integrated the **100ms SDK** for real-time video sessions with custom interactive whiteboard functionality.
- Developed **AI-driven personalised study plans** with adaptive learning algorithms.
- Deployed a **push notification system** using Expo Application Services (EAS).

KEY RESPONSIBILITIES

- Independently managed the complete mobile application development lifecycle from conception to production deployment.
- Coordinated with the backend team to design and implement RESTful APIs and WebSocket communication protocols.
- Collaborated closely with UI/UX designers and key stakeholders to ensure optimal user experience and business alignment.
- Implemented robust state management and performance optimisation techniques to ensure seamless operation.

React Native Developer | Vista Systech

February 2025 – May 2025

Evocart — Multi-Retailer E-Commerce Mobile Application (React Native / Bare Workflow, TypeScript)

TECHNICAL IMPLEMENTATION

- Developed a feature-rich React Native (TypeScript) mobile application supporting multi-retailer functionality.
- Integrated multiple **AI services**: OpenAI API for intelligent content generation based on image analysis, PixelAI for automated background removal in product images, and custom image generation based on product information and specifications.
- Implemented the **Meta Graph API** for unified management of Facebook, Instagram, and WhatsApp business integrations.
- Developed a comprehensive authentication system with **OAuth support across Facebook, Instagram, LinkedIn, and Google**.
- Independently managed the full mobile application lifecycle from conception to coordinating RESTful API design with the backend team and working directly with UI/UX designers and stakeholders.

COMPETITIVE PROGRAMMING & PROBLEM SOLVING

- **CodeChef** 1655 (Country Rank 533) · **Codeforces** 1287 (Country Rank 858)
- Solved **200+** problems on LeetCode; **750+** problems combined across all platforms.
- **Data Structures:** dynamic array, queue, stack, hash table, heap, linked list, adjacency list, tree, graph.
- **Algorithms:** sorting, searching, recursion, backtracking, dynamic programming, DFS, BFS, tree traversal, two-pointer.

OTHER SKILLS

- **AI-assisted development workflow** — ship production code in an AI-first environment using Claude Code and Cursor, including agent configuration, repository-level context and conventions, and review of AI-generated changes.
- Disciplined Git workflow — feature branches, Conventional Commits, pull-request review.
- **Leadership and communication** — led BUET Titumir Hall Volleyball and Athletics teams (2023); managed the Titumir Hall mess serving 450 students.
